

Quarkdown Mock

Giorgio Garofalo © 2024-2025

Abstract

Welcome to **Quarkdown**'s mock document. This comprehensive document serves as a **detailed reference** guide for all the visual elements that can be featured in a Quarkdown-generated document, and is structured to provide **clear and concise examples** of each. It is designed to be a resource for those interested in creating, refining and testing their own themes.

Whether you are looking to experiment with **color schemes, typography, or layout designs**, or just taking a look at some Quarkdown snippets, this mock document will provide the support you need.

To compile this document, run:

```
quarkdown c mock/main.qd -p
```

Different themes and document types may be tested
by changing the first lines of `main.qd`.

2 Paragraphs

All you need is a dream in your heart, and an almighty knife. Learn when to stop. No pressure. Just relax and watch it happen. Get away from those little Christmas tree things we used to make in school.

Let your heart be your guide. A thin paint will stick to a thick paint. There comes a nice little fluffer. It's a very cold picture, I may have to go get my coat. It's about to freeze me to death.

And I know you're saying, 'Oh Bob, you've done it this time.' And you may be right. You have to make almighty decisions when you're the creator. You create the dream – then you bring it into your world.

Anytime you learn something your time and energy are not wasted. Just think about these things in your mind and drop em' on canvas. At home you have unlimited time. Isn't that fantastic? You can just push a little tree out of your brush like that.

Little trees and bushes grow however makes them happy. The light is your friend. Preserve it. Let's make some happy little clouds in our world. When you do it your way you can go anywhere you choose. You can create anything that makes you happy.

Zip. That easy. If you don't think every day is a good day – try missing a few. You'll see. Get tough with it, get strong. Think about a cloud. Just float around and be there.

Here we're limited by the time we have. With something so strong, a little bit can go a long way. You don't have to spend all your time thinking about what you're doing, you just let it happen. Just let your mind wander and enjoy. This should make you happy. A big strong tree needs big strong roots.

The more that you practice, the more you're able to visualize things. Beauty is everywhere; you only have to look to see it. However you want to change this, that's the way it should be. It's a lot of fun. If you comply with that rule, how can you go wrong? Get a nice, even distribution of paint all through the bristles. We don't know where that goes—it doesn't matter at this point. Let's just have a good time.

Anything you are willing to practice, you can do! Think like a cloud.

11 Math

Inline

Let $F(u)$ be the *Fourier Transform* of the function $f(x)$.

Block

$$F(u) = \int_{-\infty}^{\infty} f(x)e^{-2\pi i ux} dx$$

Multiline block

$$f(x) = \begin{cases} x^2, & \text{if } x \geq 0 \\ -x, & \text{if } x < 0 \end{cases}$$

Numbered block

$$E = mc^2 \tag{1}$$

Tip: Quarkdown supports TeX macros.

$$\binom{n}{k} = \frac{n!}{k!(n-k)!}$$

12 Footnotes

The search for planets beyond our solar system – exoplanets – has transformed modern astronomy. Ever since the first confirmed detection of an exoplanet orbiting a sun-like star in 1995¹, astronomers have cataloged thousands more, revealing an incredible diversity of worlds.

Many exoplanets are found using the transit method, where astronomers detect a slight dip in a star's brightness when a planet passes in front of it². This method, popularized by missions like *Kepler*, has uncovered planets of all sizes—from Earth-like rocky worlds to gas giants larger than Jupiter.

Another technique is the radial velocity method, which detects the gravitational wobble a planet induces in its host star³. This was how the first exoplanet, 51 Pegasi b, was confirmed¹. Combining both transit and radial velocity data allows scientists to estimate a planet's density and composition.

Surprisingly, many exoplanets challenge our understanding of planetary systems. Hot Jupiters, for example, are massive gas giants orbiting extremely close to their stars—something not seen in our own solar system⁴. These discoveries force astronomers to refine models of planetary formation and migration³.

With next-generation telescopes like the James Webb Space Telescope (JWST), scientists hope to study the atmospheres of distant exoplanets in greater detail². By analyzing the starlight passing through a planet's atmosphere during a transit, researchers can search for signatures of water, methane, or even biosignatures—potential signs of life.

¹Mayor & Queloz, 1995—discovery of 51 Pegasi b.

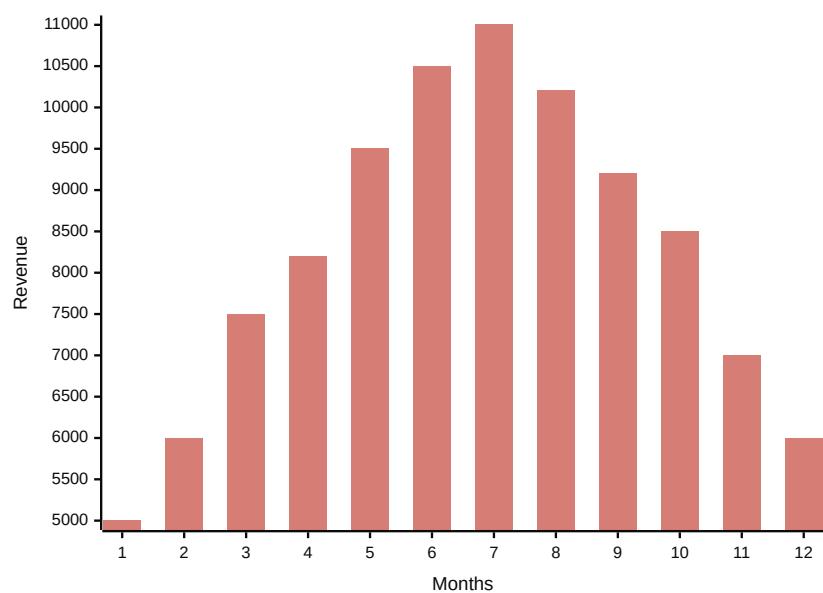

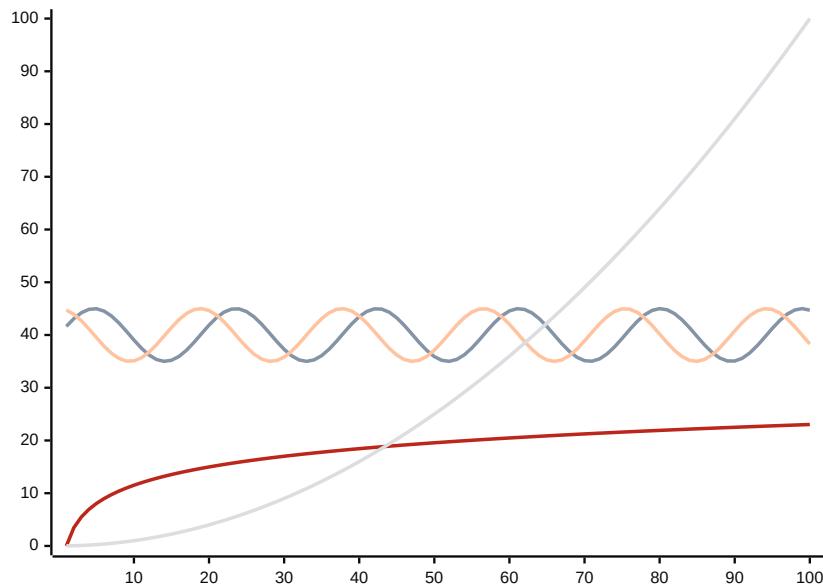

²The transit method was used extensively by NASA's *Kepler* mission.

³Radial velocity method measures the Doppler shift in a star's spectrum.

⁴Hot Jupiters are believed to have migrated inward from their original formation zone.

Some nice clouds!

A B C

There it is. In nature, dead trees are just as normal as live trees. Just a happy little shadow that lives in there. If you didn't have baby clouds, you wouldn't have big clouds.

That's it.

20 Cross-references

Section 20 shows various examples of cross-references. For instance, the Quarkdown icon shown in *Figure 20.1* features a circular design.

Figure 20.1: The Quarkdown icon

In mathematics, a circle with center at (a, b) and radius r is defined by (2):

$$(x - a)^2 + (y - b)^2 = r^2 \quad (2)$$

(2) is a special case of the more general equation (3), which defines an ellipse.

$$\frac{(x - a)^2}{r_x^2} + \frac{(y - b)^2}{r_y^2} = 1 \quad (3)$$

An ellipse is not a polygon. *Table 20.1* shows polygons and their properties.

Polygon	Sides	Internal angle sum
Triangle	3	180°
Quadrilateral	4	360°
Pentagon	5	540°
Hexagon	6	720°

Table 20.1

21 Bibliography

Einstein's publication [1] in 1905 revolutionized the field of physics, particularly in the realm of special relativity. His work laid the foundation for modern theoretical physics and has been cited extensively in subsequent research.

Similarly, Hawking's book [2] has had a profound impact on our understanding of cosmology and black holes.
